The **BeautySalonApp** is a Java Swing application designed to manage a beauty salon's client interactions. It features a user-friendly graphical interface to log in, sign up, book appointments, and handle payments.

Key Features:

Login and Signup System:

Users can log in with a username and password validated against a text file (users.txt). New users can sign up by providing a username, password, and email. The data is saved in the same file.

Main Menu:

The app provides a simple menu with options like *Help*, *Locations*, and *Exit*.

Appointment Booking:

Users can book services such as Haircuts, Makeup, and more, each with a specific cost.

Users select services, artists, dates, and times using dropdowns and lists.

Validation ensures all necessary selections are made before confirming an appointment.

Payment System:

A payment window displays the total cost and offers multiple payment methods (e.g., Cash, Credit Card).

Users enter their name and phone number during payment.

Design and Layout:

Panels and buttons are styled for a clean appearance.

Error Handling:

Includes validation for login credentials, service selection, and payment steps.

Gracefully handles file I/O operations with error messages for issues like missing or unreadable files.

Structure:

File Management: Handles user data through text files (users.txt).

Event-Driven Programming: Uses ActionListeners and MenuListeners to handle user interactions.
